Welcome to BuySpares. In this video, we'll see how to fix the E11 malfunction on Hoover's washer. Important: Before replacing the part in any electrical appliance, you need to make sure that the device is first disconnected from the network. If you have an E11 malfunction on Hoover's washer dryer this indicates problems with the dryer thermostat. Remove these screws to the top of the cupboard. Slide the lid back a little and lift it. Remove the thermostat connector by clicking on the tab, then remove the two screw retainers and remove. Replace the thermostat and refit the connector. On many machines the E11 error occurs as one or more of these break connector wires, this may be due to excessive movement from unbalanced loads. To prevent this when washing any heavy items there are enough heavy items to spread around the drum to help the machine balance its load. To repair the wires, trim the ends and restore them before insulation. Then make sure the wire can move freely without being pulled tight if the drum moves. For all spare parts, you need to visit the BuySpares website. All the information provided is only a guide. BuySpares accepts no liability for any problems that occurred when trying any advice shown. If in doubt, contact a qualified repair service. The E11 error code on Hoover's washing machine will mean that you have a malfunction with the drying sensor. If the drying sensor is damaged or malfunctioning, then you will find yourself with a washing dryer with no drying clothes after they have been washed. So if you do some light reading - you are currently facing an E11 error code. Following our guide, we will go through how easy it is to replace the sensor. From removing the top panel to installing a new part and even closing it all. Fixing your washer dryer will give you back the opportunity to wash and dry your clothes again. This video shows an example of how to remove or replace a part on a typical machine, some models may be different, but the procedure should be similar. Safety first! Please make sure that you have disconnected the device from this before starting any repairs. To begin with you need to access the inside of the device to access the dryer sensor. To do this, you will need to remove the top of the device. Start by lifting three screws on the back - once the screws have been removed you can pull the top of the top back about half an inch and it will be free to remove. Now you should be able to see the sensor dryer. Did you know: Sometimes the problem is not with the sensor itself, but actually with the wires that lead to it, especially if they are energized as they can break. If this is the case, you will need to repair the wires however, if you do so, please make sure they are well maintained and not too However, if there is a problem with the sensor, keep reading to see how easy it is to replace. From the top of the device is out of the way, see the electrical connection and shade this, this. Using the bolt driver to undo the two screws that hold it in place. Now you're almost at the finish line, however, before you replace the sensor it's worth noting that the new one won't come with a print on the inside. So make sure you remove the seal from the old sensor and put it on a new one before replacing it back in the machine. With the old sensor removed and new in place, re-screw in the screws, be sure to also connect the electric connector. With that all done, you can now refit the top panel and screw it into place. So we have one new dryer sensor installed on the washer dryer. Hopefully we've shown you how easy it is to replace the dryer sensor. For help in diagnosing and repairing the device be sure to check our other articles in our consultation center. With a replacement sensor you can give the washer dryer clean - we can offer our high rated dishwasher and washing machine cleaner. 6 superlatives of excellent cleaning can help maintain the internal components of the washer dryer, helping it to be much more efficient. To find out more, see our article here. If a malfunction is found in the washing machine, the error code may break out. Each manufacturer uses different error codes. To help you understand yours, this eSpares video explains Hoover and Candy Washing Machine error codes. For more information about your specific error code, click the relevant link below. Hi, I'm a mate of eSpares. In this video I will show you how to identify bug codes in Hoover or candy washing machine. These machines point to an error code if the machine has a problem and this will be displayed either regularly flashing light on the front or in this case a digital display. If your machine doesn't have a digital display and has a regularly flashing light on the control panel, count the number of flashes that light makes between pauses to give you an appropriate amount of error code. Now I'm going to turn off the machine and take off the top and back to help you identify the area by initiating the error code. Now that the top and back of the machine have been removed, let's go through the error codes. Safety first! Please make sure you turn off the device and disconnect it from the system before you start repairing it. The E01 error code (or on some models the error code E07) indicates a problem with the door lock. This can be a problem with the door lock itself, wiring or connecting to the PCB board. The E02 error code will indicate a filling problem. Now this either means there is a trap, blocked or pinched to fill the hose, or a problem with the water supply or with the valves. The E03 error code indicates a drainage chain problem. This usually means that something is stuck in the pump. The E04 error code can mean that there is a problem with anti-flood, which means that you have water in the base and can indicate There's a leak. The E05 error code means that you have a problem with the NTC (the water temperature sensor at the back). It can be as simple as a free connection that needs to be reconnected. The E06 error code is either a problem when the machine is out of balance if the error code is displayed immediately after the rotation, or it is a problem with a faulty control board. The E07 error code is either a problem with the door lock or with the engine jammed and unable to rotate. The E08 error code indicates a problem with the engine speed sensor. This can cause the engine to rotate at a very high speed for a few seconds before slowing down and then stopping. This can also mean that the engine does not rotate. The E09 error code means that you have problems with the engine triad on the printed board. This may mean that you don't have a drive. The E10 error code on older machines can mean that there is a problem with the motorized selector. On new machines, this may indicate a drum sensor problem when installed. Now error codes from 11 to 14 all refer to problems with washer dryers. The E11 error code indicates that the dryer has an open circuit or a problem with the module. It is a good idea to check the wiring from the sensor on top of the drum to the printed board as it can be damaged during the spin cycle. The E12 error code involves a PCB communication error or an open circuit on the dryer heater sensor. The E13 error code means that there is a problem with the PCB, as does the E14 error code. This may also indicate a problem with the hairdryer or NTC. The E15 error code indicates that there may be a board problem. It cannot be programmed or the memory chip may have been damaged. The E16 error code means that there is a heater insulation problem that can lead to tripping of your fuse box and other occasional cycle errors, but it's hard to prove without replacing the heater. The E17 error code means that there is a problem with the motor tachometer and can cause the engine to not rotate. The E18 error code means there is a problem with PCB. These are Bugs error code bugs Candy and Hoover, but they should only be used as a guide. Please watch our other video diagnosis for further help. Spare parts and accessories for washing machines and all other appliances can be found on eSpares. Thanks for watching. Watch.
